STEP 1 · Build evals

24 propensities
prosocial, antisocial, self-oriented

Per propensity, generate
questions (train / test split)
high- & low-expression reference answers
trait-eliciting system prompts
LLM-judge rubric, score 0–100

Filter cross-trait confounds
drop questions that load on unintended traits

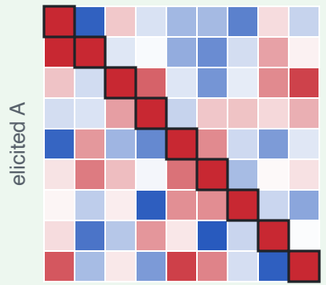

24 eval sets, one judge rubric each

STEP 2 · Elicit & measure

System prompt | ICL | SFT | GRPO

Qwen3.5-9B · Qwen3.5-9B-Base · Nemotron-3-Super-120B

Elicit propensity A (+ or – pole)
then score the model on all 24 evals

Spillover matrix
Δ score vs. base model, logit-transformed, z-scored

diagonal = on-target
off-diagonal = spillover

one matrix per method × model

STEP 3 · Analyze

Compare elicitation methods
cheap (SP, ICL) vs. costly (SFT, GRPO)
symmetry: A→B vs. B→A

Forecast spillover
Claude Opus 5.5 forecasts · self-prediction
human-psychology prior · empirical baselines

Latent structure
trait factors (EFA) vs. human constructs
fine-tune directions in activation space

Training-pipeline confounds
null fine-tune (no target trait)
data-generating model
